APRIORA Workshop: Apply the tool yourself!

As a special, the APRIORA team organises a practical stakeholder workshop for end-users of the developed risk-assessment tool. In accordance with the European Urban Wastewater Treatment Directive, it helps to prioritise upgrades with quaternary treatment techniques at mid-sized wastewater treatment plants. Focused on strategic water management, the authorities in charge and sewage treatment plant operators can also perform preliminary assessments of the effectiveness of measures.

Join us to experience the pharmaceutical path of risk assessment within the QGIS tool and get in touch with the developer and experts in the field. Participants can either apply the tool step-by-step themselves on own devices or follow-up the session visually. Our experts will guide you through the application of the developed QGIS tool and demonstrate the integrated modelling options and previous pilot results.

If you would like to actively participate, it is required to bring an own device with a pre-installed version of QGIS (minimum version 3.0). The applicable test package will be provided to all joining participants at the beginning of our practical workshop on Thursday afternoon.

Be among the first to try out the tool and help shape its future development!
