## Riga's CCC action portfolio and GHG inventory

# Integration of solar energy

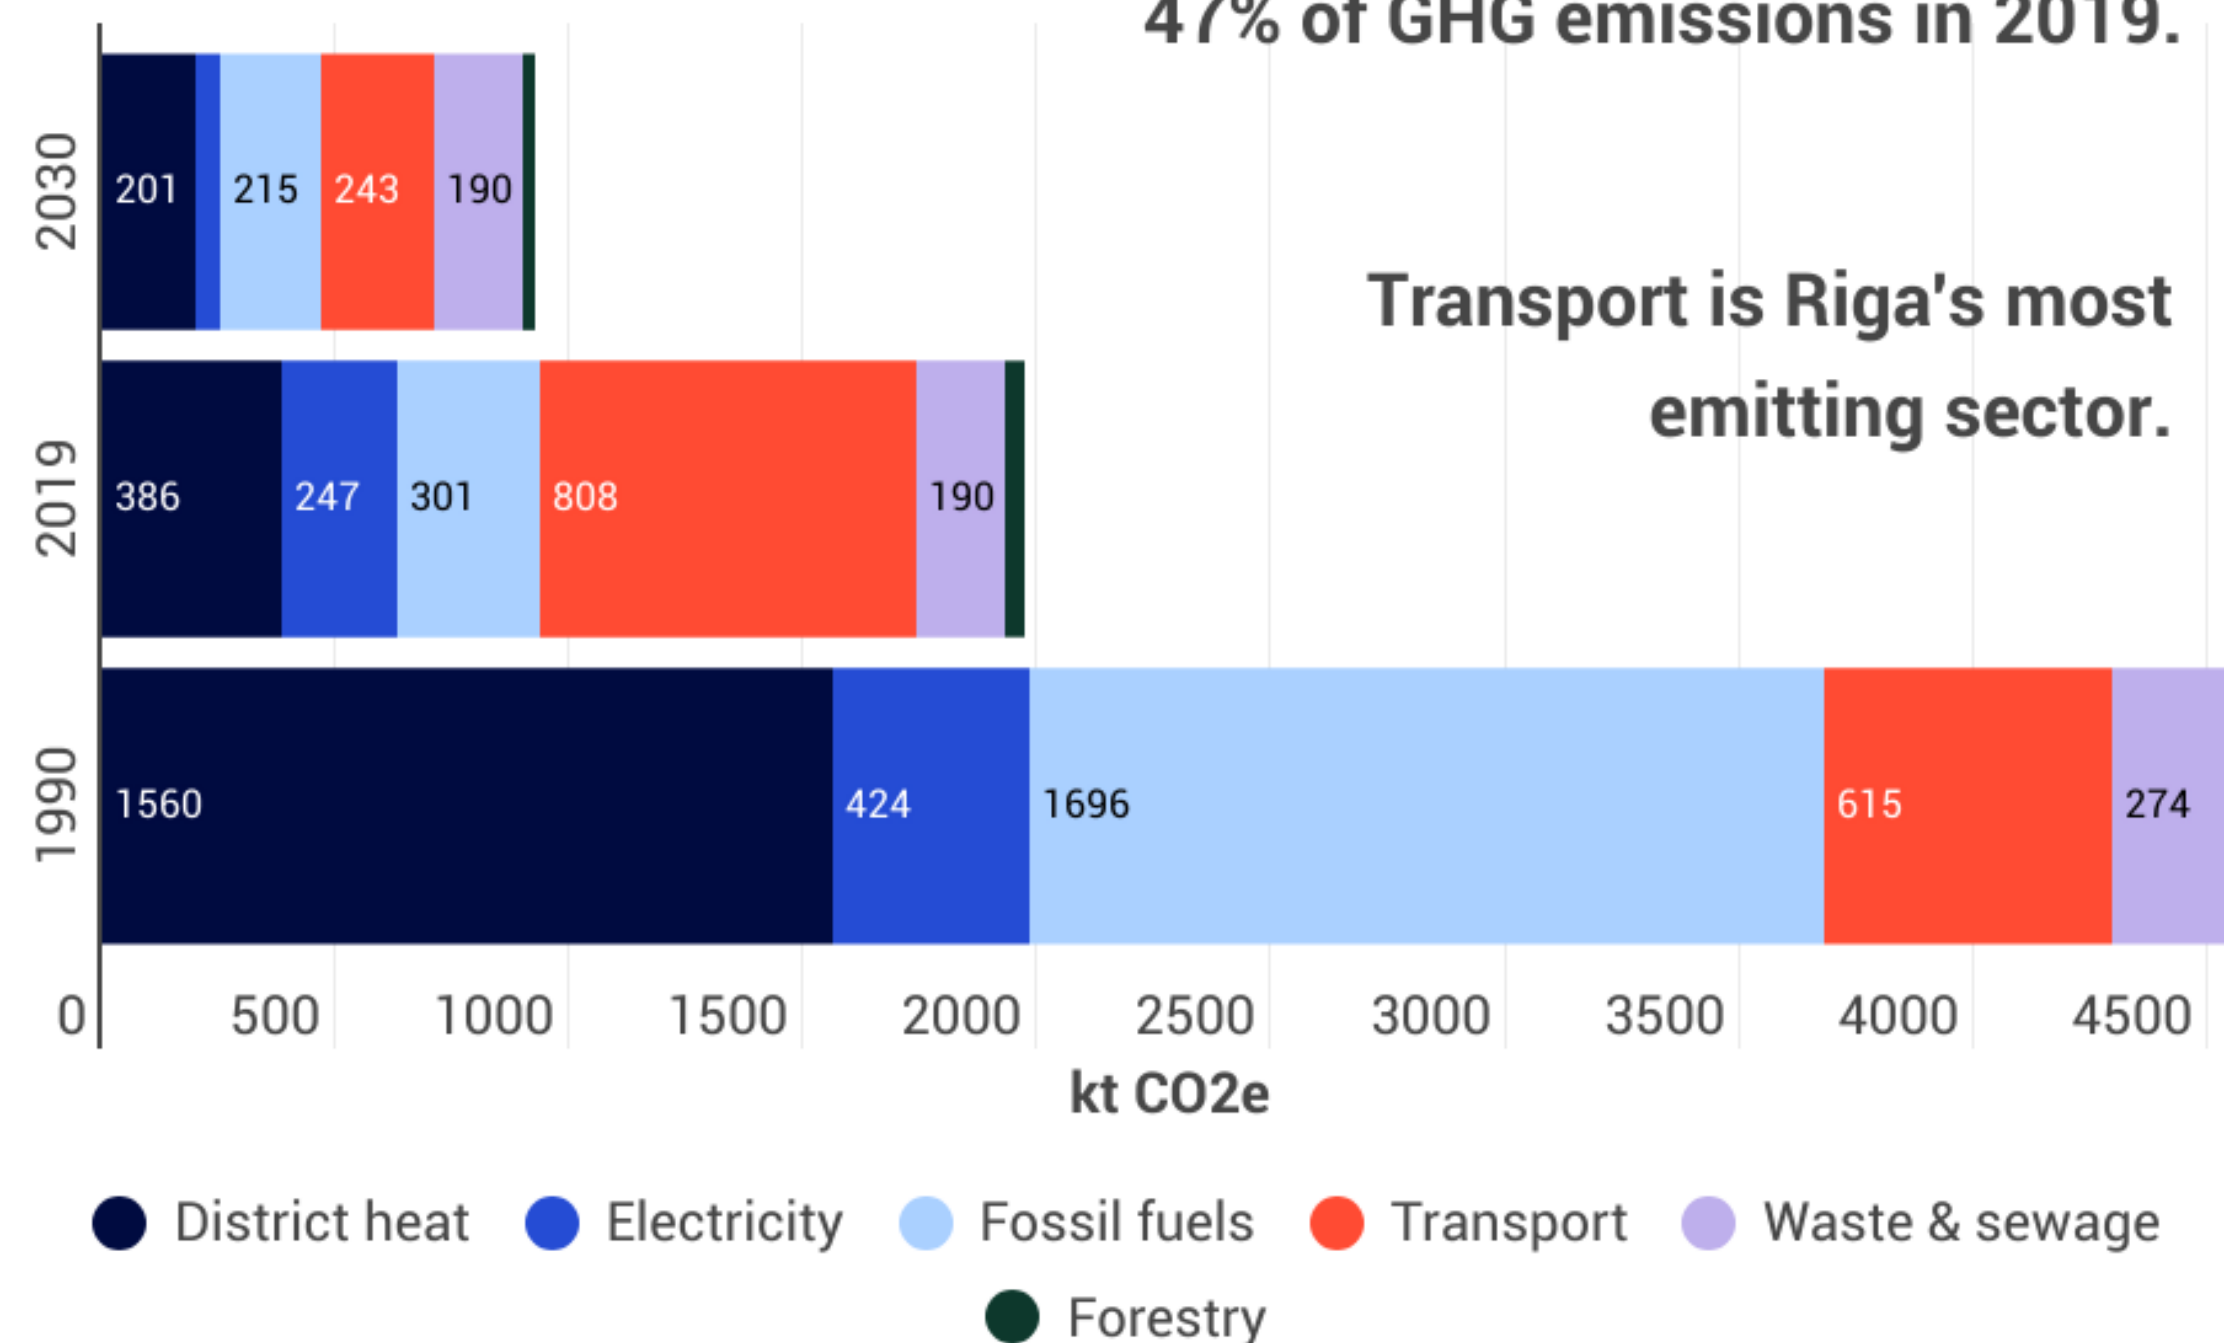

Krista Petersons, Riga Energy Agency

31-03-2026

# Main sources of Riga's GHG emissions

Use of fossil fuels in district heating, electricity generation and local combustion produced 47% of GHG emissions in 2019.

Transport is Riga's most emitting sector.

**Riga's 2030 goal in GHG reduction: 30% or 53% compared to 2019**

CCC ambition is higher than the goals set in Riga's Development Programme and Investment Plan 2021-2027.

# GHG emissions by sector

In 2020, Riga's total\* CO<sub>2</sub> emissions were 1629 kt.  
Municipal infrastructure and  
public transportation each  
produce only 2%.

\* Excluding waste and forestry sectors.

**Municipal infrastructure  
accounts for a small  
share of Riga's GHG  
emissions – 2%.**

Most measures must be implemented in cooperation with  
other stakeholders – important to consider the boundaries  
and impacts of municipal climate budgeting.

# Energy production

**37%**  
of total reduction

Riga's priority is phase-out of fossil fuels and efficiency measures in Riga's district heating (DH) and decentralised systems.

## 7 fields of action

- E1** Zero-emission & RES technologies in DH
- E2** Connect new clients to DH
- E3** Efficiency measures in DH systems
- E4** Low-temperature DH networks
- E5** Innovation projects

- E6** Electrification, RES or DH for decentralised heating
- E7** Use of RES for electricity generation

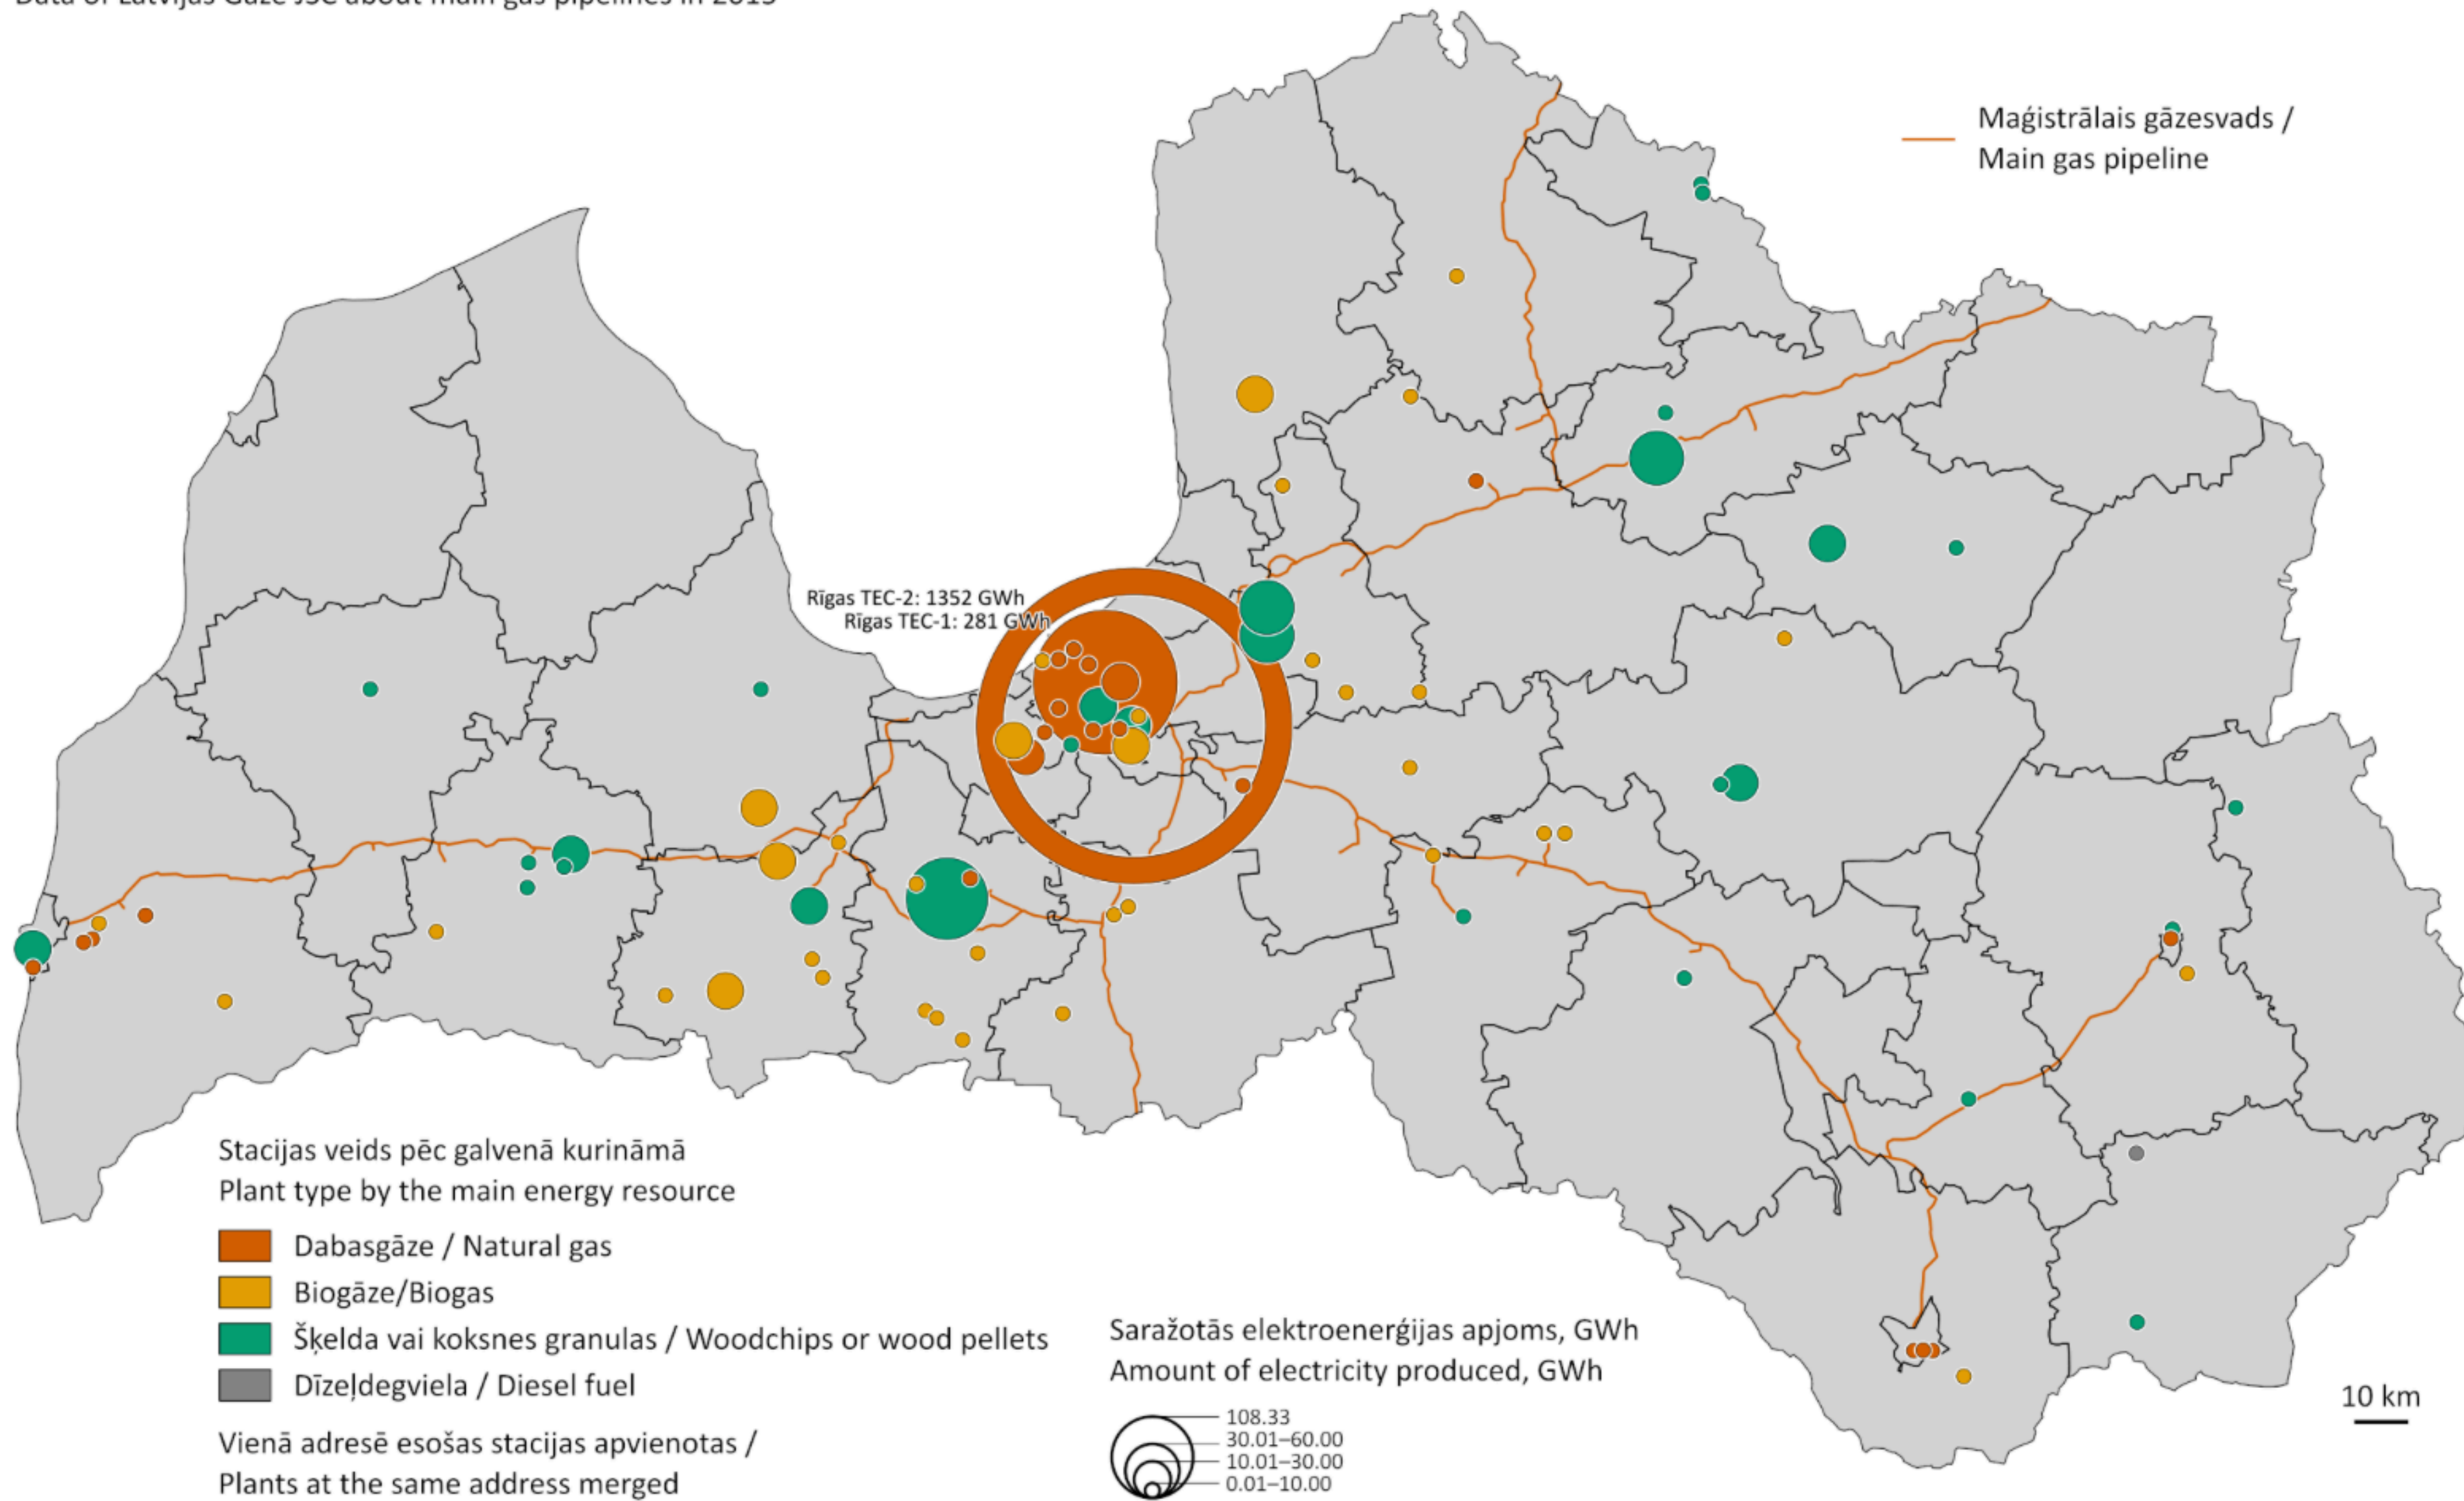

Decarbonization of electricity supply is expected to contribute most, followed by heat energy

The National Energy and Climate Plan envisions a 100% RES share in electricity generation by 2030. The target may be revised.

Riga's district heating strategy is under development. The more realistic scenario will depart from the ambition set in the climate contract.

# Koģenerācijas stacijās saražotā elektroenerģija 2024. gadā Produced electricity in combined heat and power plants in 2024

AS "Latvijas Gāze" dati par par maģistrālajiem gāzesvadiem 2015. gadā  
Data of Latvijas Gāze JSC about main gas pipelines in 2015

**Challenge I –  
the highest  
share of  
fossil fuels**

**95% of  
electricity  
produced in  
Riga is fossil**

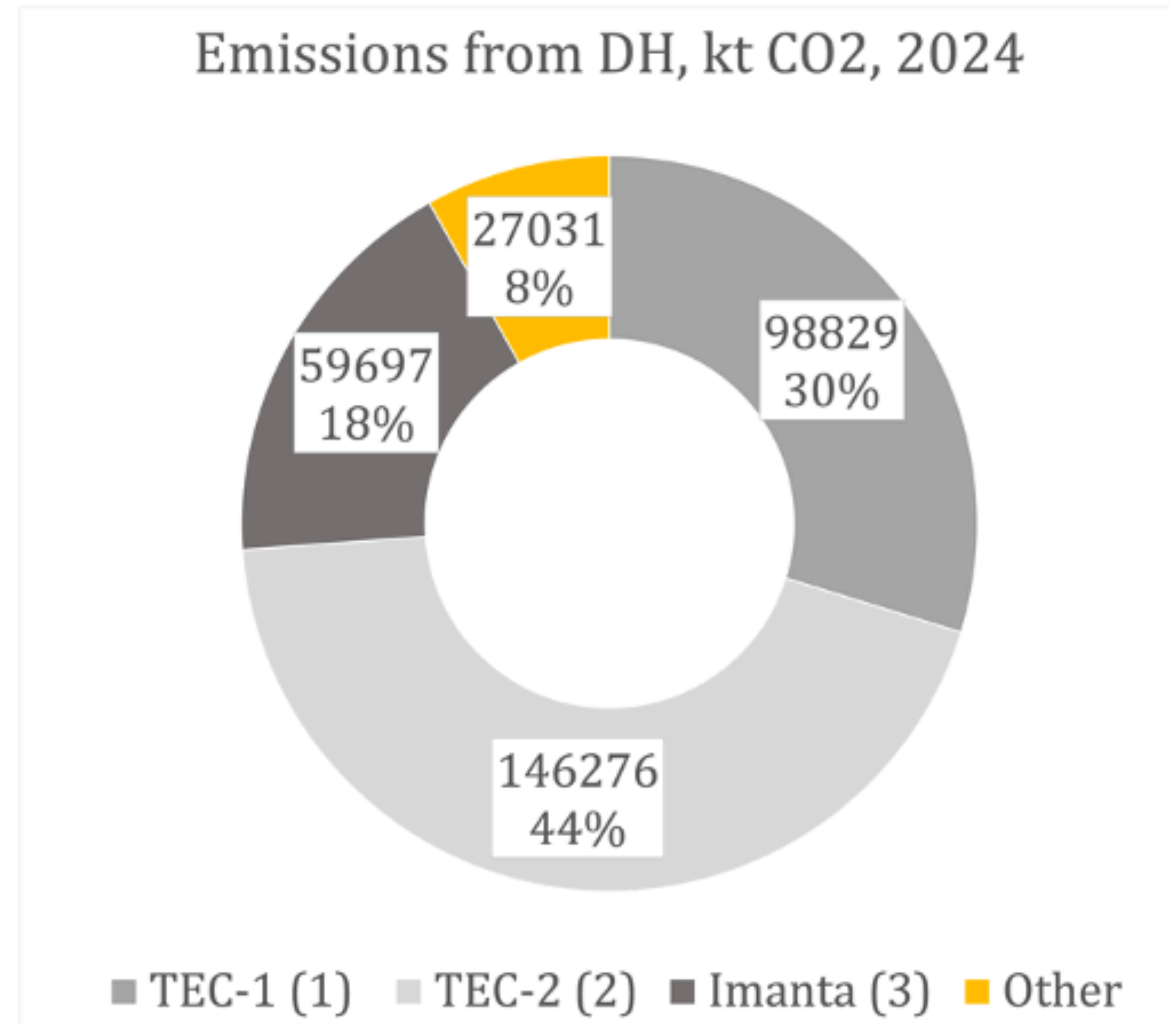

**LV average –  
27% in 2024**

## Challenge II – the two largest sources of GHG emissions are cogeneration plants of national importance

# Riga's DH emissions and final consumption

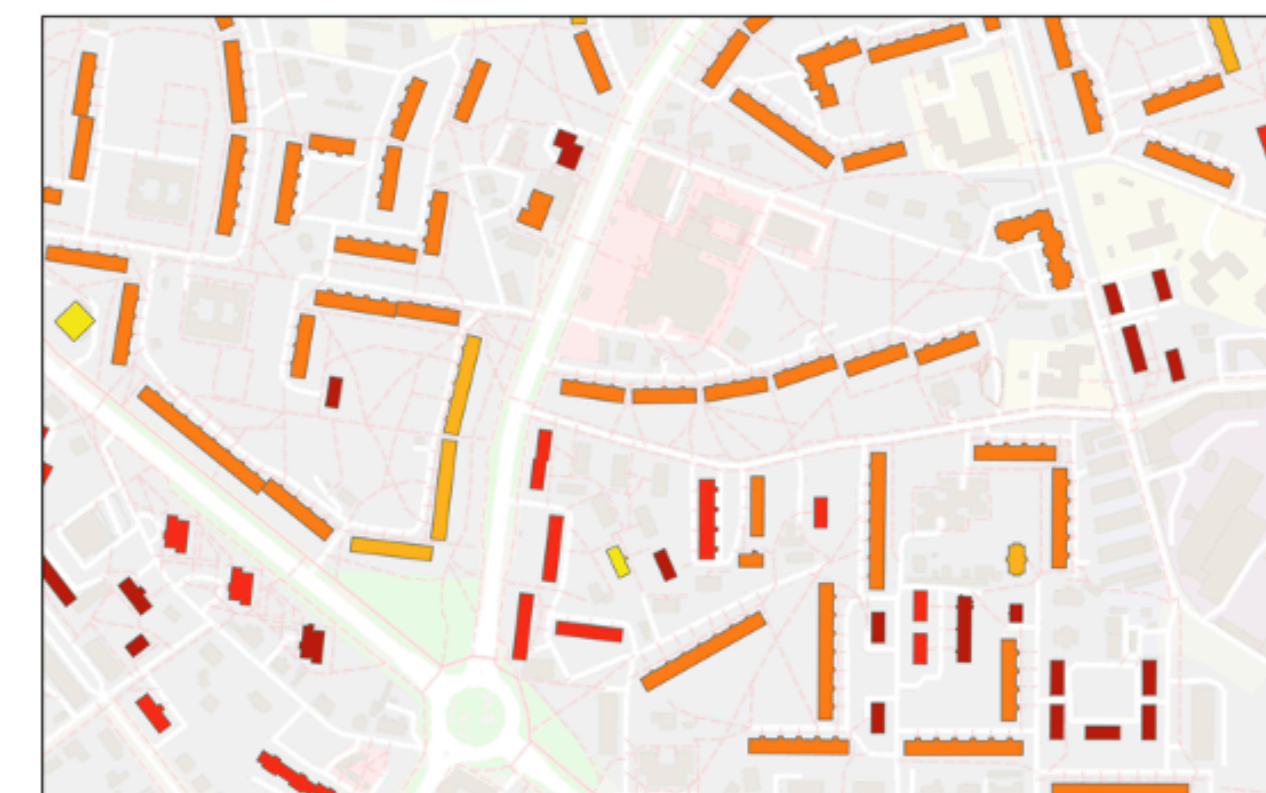

Emissions from DH, kt CO<sub>2</sub>, 2024

There are 55 energy production facilities in Riga's district heating system.

**The 3 largest plants contribute to 92% of the total CO<sub>2</sub> emissions.**

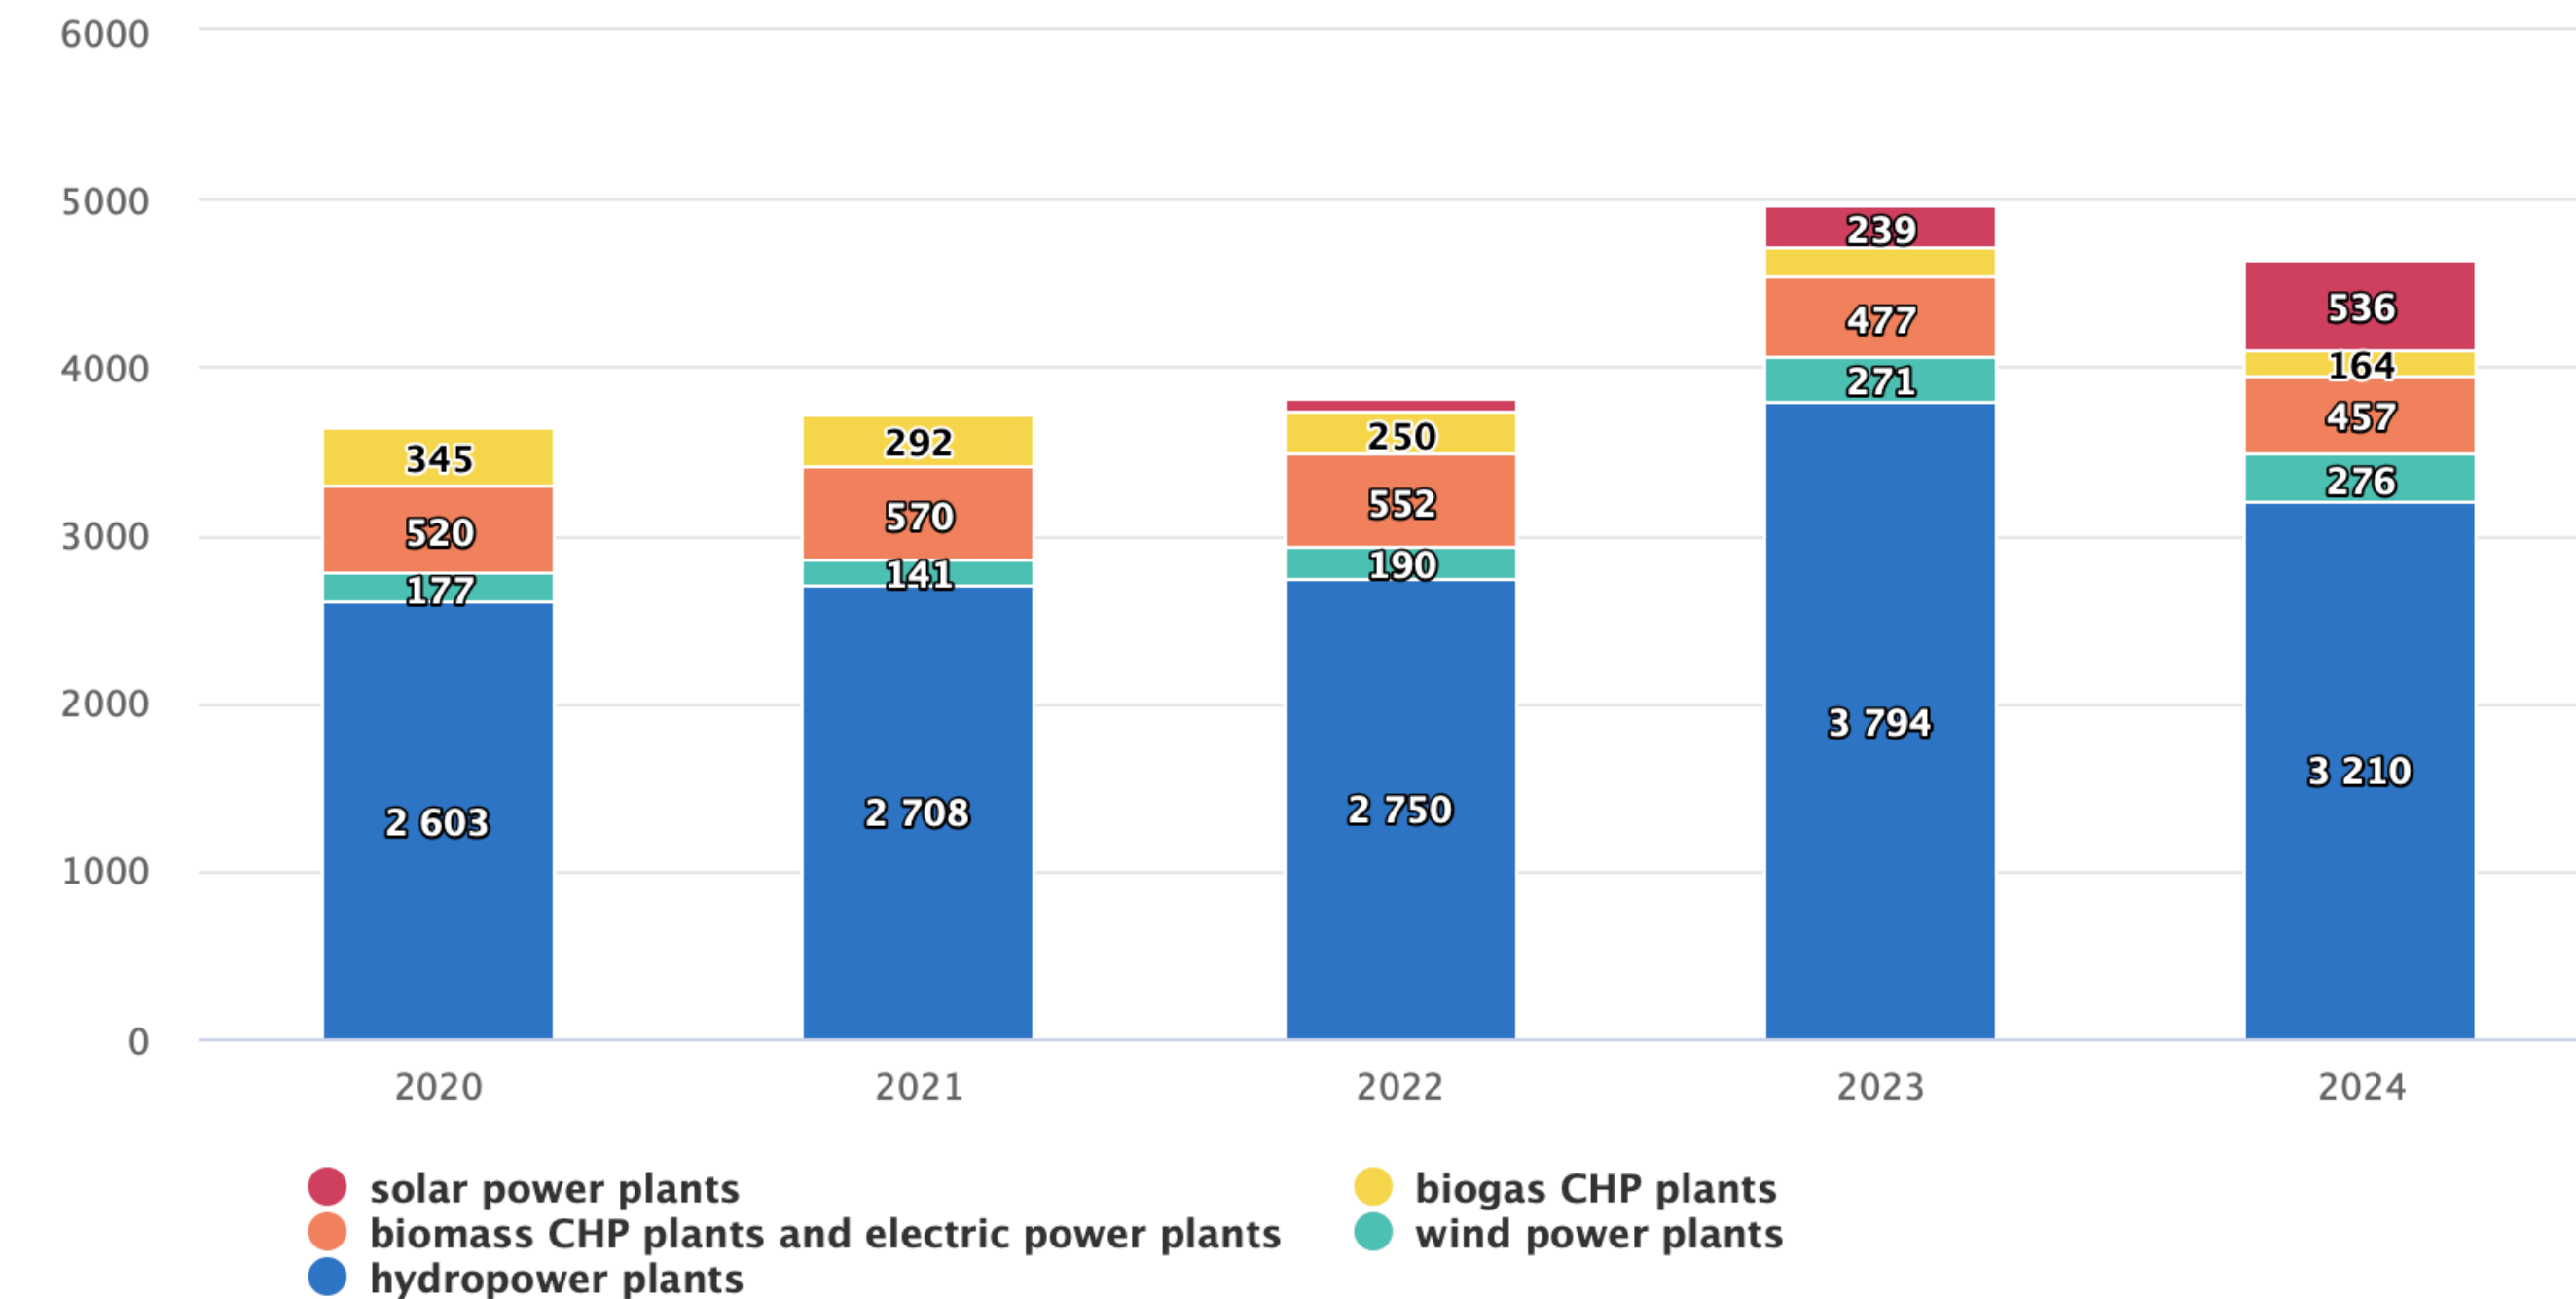

Final consumption is above optimal because of low energy efficiency in the building sector.

# CCC Measure E7: Renewable electricity generation

## Electricity produced from renewables

(gigawatt hours)

Refer to the OSP database: [ENA040](#)

Image: Official Statistics Portal

## Integration of solar energy: national and local measures

On the national scale, hydropower contributes most. Solar generation has increased in the last few years. Wind potential still untapped.

Latvia has the 4<sup>th</sup> highest share of renewables in the final consumption – 43% in 2024. 7<sup>th</sup> place in renewable electricity consumption – 55% in 2024.

Solar “boom” started in the detached housing sector, followed by commercial buildings. Multiapartment buildings – rare cases.

Major impact of EU and ETS funding

**Installed PV capacity in Riga increased from 10MW at the end of 2022 till 64MW in 2025.**

There were 2100 microgenerators and 308 solar stations at the end of 2025. 90% of microgenerators belong to natural persons.

## Riga's CCC action portfolio and GHG inventory

Installed solar PV  
on municipal  
buildings

Year	kWp
<b>2019</b>	<b>31</b>
<b>2020</b>	<b>31</b>
<b>2021</b>	<b>31</b>
<b>2022</b>	<b>31</b>
<b>2023</b>	<b>81</b>
<b>2024</b>	<b>201</b>
<b>2025</b>	<b>659</b>

More projects in the pipeline, supported by Modernization Fund.

# Riga municipality invests energy efficiency savings in rooftop PV for public buildings – EUR 1.2 million

Benefits from participation in the energy management system. Schools and social rehabilitation facilities completed.

Electrification measures in district heating

## Riga's district heating company has invested EUR 3.8 million in 49MW electric boiler

The goal is to replace fossil gas when electricity prices are low and provide balancing services to the power system.

Image: Green Liberty

## Riga's CCC action portfolio and GHG inventory

Riga's GHG inventory does not show the impact of local decarbonization measures because a constant CO2 emission factor is applied to the distributed electricity.

CO2 emissions from electricity consumption

t CO2	2020	2021	2022	2023	2024
Municipality	3630	3301	3861	3687	3758
Total Riga	214000	213000	209000	201000	211141

**Local action is integrated in broader energy market and policy conditions**

Direct financial impacts.

**Direct municipal investments tackle a small part of energy emissions**

Collaboration and policies matter. Top-down and bottom-up GHG approaches differ.

**Methodological questions about GHG intensity of electricity consumption**

Temporal and geographic aspects.

# Thank you!
